IP-audio: background music and internetradio without limitations

Customized in-store audio

Getting the right content at the right payout location was never easier: With the advent of audio over IP it is possible to deliver store-specific music and localized commercials. Using internet as the distribution network, Streamit offers a complete solution that is easy, fast to set up and cost-effective. It is an ideal solution for providing branded music to multiple locations, scalable from a few stores to thousands.

Complete solution, selective implementation

Tailoring the music to a store or brand is vital. You can do this yourself, or contract a professional music provider. For the rest Streamit offers a palette of products and services from the streaming side to the receiving side. Together they form a complete solution, but they can be selected and combined as needed. Streamit's use of open standards ensures perfect integration.

Streaming and distribution

Making it easy to start streaming branded music, Streamit developed platforms to manage the streaming, distribution and reception of the audio. No matter where you are, the platforms provide central management of all connected DSL or satellite receivers. Receivers can be configured and monitored remotely, receive tasks to be performed as scheduled, and even receive software updates. Depending on your wishes and feature requirements, the platforms are available as a free service, hosted, or stand-alone.

The Streamit Audio Distribution Platform allows the user to log in and upload new content, manage playlists and configure streams or store-and-forward programs. The audio distribution platform is available as a standalone product or as a hosted service. The hosted service is available in our own data centre or through one of our partners and offers various business opportunities. ChannelService, the other Streamit platform, is available for free. At this webportal the user can set up their own radio channel or use publicly available internet radio streams.

IP-audio receivers

For the receiving of IP-audio Streamit developed a series of professional internetradio receivers (SIR series). Whether DSL or satellite*, high or limited bandwidth, Streamit's internet radio receivers are up for the task. They can receive streams from IP networks, or use store and forward to deliver the audio. These devices convert the data from Internet into analogue audio as input for your audio system. The SIR Series internetradio receivers are intended for professional use and bring a set of special features, such as encryption and security functions and an on-board SD-card slot for backup.

*using DVB-S2 MPE-encapsulated IP in MPEG2-TS
